Professional Summary

Full Stack Developer with 3+ years building the APIs behind a hosting SaaS: billing, accounts, payments, and provisioning. PHP, JavaScript, and AJAX services back dashboards used by 5,000+ users. Stripe and Razorpay confirm a payment and activate the service. MasterGST creates the GST invoice from that order, which removed 9+ hours of manual finance work each week and took filing errors on this flow to zero. A Fastify and PostgreSQL control plane takes a GitHub repo or ZIP through Harbor and Helm to a live Kubernetes URL.

Skills

APIs: PHP, JavaScript, AJAX, RESTful APIs, Node.js, Express.js, Fastify, Python, FastAPI, Webhooks, Authentication and Authorization

Data: MySQL, PostgreSQL, MongoDB, Firebase

Integrations: Stripe, Razorpay, MasterGST, Slack Webhooks, GitHub Apps, Payment Gateways, Third-Party APIs

Platform: Docker, Kubernetes, Helm, Harbor, Linux, Nginx, GitHub Actions

Clients of these APIs: React.js, TypeScript, HTML5, CSS3, D3.js

Work Experience

Full Stack Developer, Hostzop Cloud Technologies Pvt. Ltd. Aug 2023 - Present

Chennai, India

- Problem: billing, sign-in, provisioning, and the user record were separate calls with no shared checks. I built those APIs in PHP, JavaScript, and AJAX, with authentication, validation, logging, and centralized error handling. Impact: one account runs the order, the user, and the service for 5,000+ dashboard users.
- Problem: a successful payment left the service off, and the GST invoice was retyped from the same order. I connected Stripe, Razorpay, and MasterGST to the billing APIs. Impact: a paid order turns on with no manual step, about 9 hours of finance work came off each week, and filing errors on this flow went to zero.
- Problem: a customer repo or ZIP became a live URL only after someone edited the server. I built the deploy API in Fastify and PostgreSQL: stack detect, image build, Harbor, a Trivy scan, Helm, TLS, and DNS. Impact: a bad image is blocked, and the app gets a live URL with no manual server step.
- Problem: reseller credits, the monthly plan, and usage were not one account. I built the APIs to buy and resell VMs, with separate admin and reseller logins. Impact: the purchase starts provisioning, which cut VM setup from 40 minutes to 5 minutes.
- Problem: an unresolved hosting question stopped in the chat, and a package install or a new folder was a second manual job. I built the FastAPI assistant so it reads the internal docs, connects to the server, and opens a ticket only when it cannot finish the fix.

Full Stack Developer Intern, Aspire Systems Apr 2023 - Jul 2023

- Engineered a real-time face-recognition attendance system using Python, OpenCV, cvzone, and NumPy.
- Serialized a face-matching model with pickle and sent recognized attendance records to Firebase.

Projects

Billing and Account APIs

PHP, JavaScript, AJAX, MySQL

- Problem: the order, the user, and the service each had their own path, so a change in one did not update the others.
- Built: the billing, authentication, provisioning, and user-management APIs in PHP, JavaScript, and AJAX, with validation, logging, and one error handler for external calls.

- Built: MySQL holds the account, the plan, and the service state, and the dashboard reads that same record.
- Impact: one account runs the order, the user, and the service for the dashboards used by 5,000+ users.

Payment and GST APIs

Stripe, Razorpay, MasterGST API, PHP, MySQL

- Problem: Stripe or Razorpay could take the money while the service stayed off, and finance retyped the GST invoice from that order.
- Built: the payment check against Stripe and Razorpay, and the successful payment writes the billing state and activates the service.
- Built: the MasterGST call from that same order, with GSTIN and invoice fields checked before the invoice is filed.
- Impact: a paid order turns on with no manual step. This removed 9+ hours of manual finance work each week, and filing errors on this flow went to zero.

Deploy Control Plane API

Fastify, PostgreSQL, Docker, Kubernetes, Helm, Harbor

- Problem: a GitHub repo or a ZIP became a live URL only after someone built the image and edited the server.
- Built: the Fastify API and PostgreSQL record for stack detect, image build, Harbor, Helm, TLS, and DNS, with Trivy blocking a bad image before install.
- Impact: the customer gets a URL from the API, and a failed scan never becomes a live site.

Reseller Account APIs

PHP, JavaScript, AJAX, MySQL

- Problem: buying a VM, the credit balance, the monthly plan, and usage lived apart, so a reseller order waited on a person.
- Built: the APIs to purchase, manage, and resell VMs, with credit billing, monthly plans, usage, and separate admin and reseller logins.
- Impact: the purchase starts provisioning, which cut that setup from 40 minutes to 5 minutes, and sales and cost sit on one account.

Support Assistant API

Python, FastAPI, LangChain, FAISS

- Problem: a hosting question had no API path into the docs or the server, so support did DNS, SSL, and stack checks by hand.
- Built: the FastAPI service. LangChain and FAISS pull the matching docs, and the model answers only from that text.
- Built: the same API connects to the server to install packages, create files and folders, and run DNS, SSL, and stack checks. If it cannot finish, it opens a ticket with the chat context.
- Impact: the chat, the server action, and the ticket are one API. A person steps in only when the assistant cannot finish the fix.

Education

Bachelor of Computer Applications (BCA) 2019 - 2022

Mohamed Sathak College of Arts and Science, Chennai

Diploma in Counseling Psychology (Online) 2020 - 2021

Sypa IIE

Certifications

- Full Stack Development - Offline Training
- Back-end Development - Meta
- JavaScript - Udemy
- Fundamentals of Cybersecurity - upGrad
- UX Design Process: Empathize, Define, and Ideate - Google

Awards

- Best Performer Award during the Aspire Systems internship for technical contribution and reliability.
- Led a 10-member team during NCC Camp, with responsibility for coordination and accountability.
