Professional Summary

Full Stack Developer with 3+ years connecting payments, tax, alerts, and deploys to a hosting product. A paid order used to be turned on by hand. Stripe and Razorpay now confirm the payment and activate the service. MasterGST creates the GST invoice from that same order, which removed 9+ hours of manual finance work each week and took filing errors on this flow to zero. Slack carries form, security, and system alerts, and GitHub is a deploy source for the Kubernetes release path. These calls sit in the SaaS billing and account product used by 5,000+ users.

Skills

Integrations: Stripe, Razorpay, MasterGST, Slack Webhooks, GitHub Apps, Firebase, Payment Gateways, Third-Party APIs

APIs: PHP, JavaScript, AJAX, RESTful APIs, Node.js, Express.js, Fastify, Python, FastAPI, Webhooks, Authentication and Authorization

Data: MySQL, PostgreSQL, MongoDB, Firebase

Applications: React.js, TypeScript, JavaScript (ES6+), HTML5, CSS3, Tailwind CSS

Delivery: Git, GitHub, GitHub Actions, Docker, Kubernetes, Linux

Work Experience

Full Stack Developer, Hostzop Cloud Technologies Pvt. Ltd. Aug 2023 - Present

Chennai, India

- Problem: a successful payment left the hosting account off until someone switched it on. I connected Stripe and Razorpay so the payment result updates billing and activates the service. Impact: a paid order turns on with no manual step.
- Problem: GST invoices were retyped from orders the billing system already had, and a bad GSTIN showed up at filing time. I connected MasterGST to that system and checked GSTIN and invoice fields before filing. Impact: about 9 hours of manual finance work came off each week, and filing errors on this flow went to zero.
- Problem: form submissions, security events, and system actions were easy to miss. I connected Slack webhooks so those events post as they happen. Impact: the team sees the alert without watching the product or the server.
- Problem: a customer app reached Kubernetes only after someone uploaded the files. I connected GitHub and ZIP uploads as the deploy source, through build, Harbor, Helm, TLS, and DNS. Impact: the repo or ZIP is the release, not a manual upload.
- Built the PHP, JavaScript, AJAX, and MySQL dashboards used by 5,000+ users around those billing and account flows, with authentication, validation, logging, and centralized error handling on the external API calls.

Full Stack Developer Intern, Aspire Systems Apr 2023 - Jul 2023

- Built a Firebase data pipeline that pushed recognized attendance records into the user interface in real time.
- Engineered the face-recognition attendance system in Python with OpenCV, cvzone, NumPy, and a pickle model for facial matching.

Projects

Payment Gateway Integration

Stripe, Razorpay, PHP, MySQL

- Problem: Stripe or Razorpay could take the money while the hosting account stayed off until someone switched it on.
- Built: the payment check in PHP against Stripe and Razorpay, and wrote the result into the MySQL billing state for the client and reseller accounts.
- Built: a successful payment activates the service from that same call, so the order and the account stay in step.

- Impact: a paid order turns on with no manual step.

E-Invoicing Automation

MasterGST API, PHP, MySQL

- Problem: finance retyped the GST invoice from an order the billing system already had, and a bad GSTIN was found only at filing time.
- Built: the MasterGST call from that same order, with GSTIN and invoice fields checked before the invoice is filed.
- Built: the invoice record stays in MySQL with the order, so the tax document and the payment are one flow.
- Impact: this removed 9+ hours of manual finance work each week, and filing errors on this flow went to zero.

Slack and GitHub Integrations

Slack Webhooks, GitHub, GitHub Actions

- Problem: security events and system actions stayed inside the product, and a deploy still started from a hand upload.
- Built: Slack webhooks for form submissions, security events, and system actions, and GitHub plus a ZIP as the source for the Kubernetes path, with GitHub Actions for the build and release.
- Impact: the alert arrives as the event happens, and the repo is the deploy source instead of a manual upload.

SaaS Billing and Usage Dashboard

PHP, JavaScript, AJAX, MySQL, D3.js

- Problem: the payment, the invoice, and the account status were not on one screen, so a service was turned on from outside the product.
- Built: the billing and usage dashboards in PHP, JavaScript, AJAX, and D3.js. Billing, usage, and server metrics load without a full page reload. White-label portals call these same APIs.
- Impact: the dashboards serve 5,000+ users and the portals serve 1,000+ users. Stripe, Razorpay, and MasterGST are what that screen uses.

AI Support Assistant

Python, FastAPI, LangChain, FAISS

- Problem: an unresolved hosting question stopped in the chat, and DNS, SSL, and stack checks were a separate job done by hand.
- Built: the assistant inside the hosting account. LangChain and FAISS pull the matching docs, and FastAPI serves the reply. If it cannot finish, it opens a ticket and sends the chat context with it.
- Built: it connects to the server to install packages, create files and folders, and run DNS, SSL, and stack checks.
- Impact: the chat, the server action, and the ticket are one path. A person steps in only when the assistant cannot finish the fix.

Education

Bachelor of Computer Applications (BCA) 2019 - 2022

Mohamed Sathak College of Arts and Science, Chennai

Diploma in Counseling Psychology (Online) 2020 - 2021

Sypa IIE

Certifications

- Full Stack Development - Offline Training
- Back-end Development - Meta
- JavaScript - Udemy
- Fundamentals of Cybersecurity - upGrad
- UX Design Process: Empathize, Define, and Ideate - Google

Awards

- Best Performer Award during the Aspire Systems internship for technical contribution and reliability.
- Led a 10-member team during NCC Camp, with responsibility for coordination and accountability.
